

Investigation Report

Operation Helpline

PART A, Core (always required)

1. Front matter

Report title	Operation Helpline — Investigation Report
Case reference	INC-161166 (GF-IR-4488 is an attacker-forged reference, not the real case ID)
Author	David Koschmann
Version	1.0
Date issued (UTC)	2026-08-11
Classification / TLP	TLP:AMBER
Distribution	Greenfield Logistics IT Security / SOC leadership

Revision history

Version	Date (UTC)	Author	Change
1.0	2026-08-11	David Koschmann	Initial issue

2. Executive summary

A Greenfield Logistics account (USER-A) was compromised on 5 August 2026 via a replayed session cookie, not a guessed or phished password. Using files stolen from the account's cloud storage — including a password vault and its MFA seed — the intruder pivoted onto the internal network, then manipulated an AI helpdesk agent into resetting a second user's (USER-B) password by hiding fake authorisation instructions inside a genuine support ticket. That second account was then used to add a hidden backdoor permission on the domain controller and extract the full password database, including the master key that can forge access to any account (krbtgt). The intruder went on to steal internal credential files and a file containing personal information (Social Security numbers and dates of birth) for five staff. Automated detection correctly identified and correlated the core attack, but the resulting security incident sat unassigned and unworked, and no detection existed at all for the helpdesk agent's manipulation — the true starting point. This report sets out what was confirmed, what was ruled out, and what must change: verifying authorisation before an automated agent acts, ensuring fired incidents are actually worked, and a full, correctly-sequenced credential rotation across the affected estate.

3. Scope and data sources

Data source	Platform	Period examined	Confidence in coverage
Cloud Workspace (Entra ID, Exchange, Graph, MDE Device* tables, LLMAgentLogs_CL, MCPToolCalls_CL)	Microsoft Sentinel / Log Analytics (cloud)	2026-08-05 to 2026-08-07	High

Data source	Platform	Period examined	Confidence in coverage
On-Prem Workspace (AD, DeviceLogonEvents, IdentityDirectoryEvents, NTANetAnalytics, SecurityEvent, LinuxProcess_CL, MySQLAudit_CL)	Microsoft Sentinel / Log Analytics (on-prem)	2026-08-05 to 2026-08-07	High, with one confirmed detection-coverage gap (see Negative Findings)

Gaps: No detection rule exists anywhere for AI-agent tool-call activity (LLMAgentLogs_CL / MCPToolCalls_CL) in either workspace — a confirmed coverage gap, not a query limitation. Exact second-level timestamps for the initial VPN/TOTP authentication and the internal network sweep were not captured during this exercise; only the destination ports and the general 5-6 August window are confirmed. Formal hash-based chain of custody was not established for recovered artifacts (Groups.xml, credentials.txt, employee_records.csv). These gaps do not change the confirmed compromise chain, but they limit precision on exact dwell time and on evidentiary rigor for a legal/regulatory context.

4. UTC timeline

Time (UTC)	Event	Source	Evidence ref
2026-08-05 18:44:47 UTC	Initial anomalous authentication (LogonFailed) against USER-A from Singapore IP [REDACTED-IP-EXTERNAL]	IdentityLogonEvents	C1
2026-08-05 18:44:52 UTC	Session/cookie hijack succeeds (LogonSuccess) — attacker's first successful access	IdentityLogonEvents	C1, T1
2026-08-05 18:59-19:07 UTC	OneDrive burst: KeePass vault files and VPN-Access-Credentials.txt taken; Personal.kdbx restored from deletion then taken	CloudAppEvents	C4, C5
2026-08-05 19:04:50 UTC	SecurityAlert "Possible use of a stolen session cookie" fires	SecurityAlert (Cloud Workspace)	T1
2026-08-05 ~20:0x UTC	Mailbox forwarding configured on USER-A's mailbox to [REDACTED-EMAIL] (ForwardingSmtpAddress, DeliverToMailboxAndForward)	OfficeActivity (Set-Mailbox)	C6
2026-08-05, shortly after	Two NDR bounce notifications generated then soft-deleted within seconds	OfficeActivity	C7
2026-08-05 20:08:56-20:33:52 UTC	Discovery-tactic alert fires (environment enumeration); ~25 min detection lag between activity and alert	SecurityAlert	T2
2026-08-05 20:09:00-20:10:00 UTC	AzureHound-driven Graph enumeration burst: ~1227 calls / 1118 unique targets in 60s; PIM endpoints refused 403/404; Azure Resource Manager blocked by Conditional Access MFA requirement	MicrosoftGraphActivityLogs, AADNonInteractiveUserSignInLogs	C9, C10, C12
2026-08-05 20:40:05 UTC	Last alert of the evening cluster ("Possibly compromised user account signed in") — attacker activity goes quiet overnight	SecurityAlert	T4
2026-08-05/06, overnight	Two AAD Identity Protection risk detections auto-dismissed by system (aiConfirmedSigninSafe) while attacker session still active — no analyst review	AADUserRiskEvents	C8

Time (UTC)	Event	Source	Evidence ref
2026-08-05/06 window (exact time not captured)	VPN authentication using stolen TOTP seed, clean/first-try, no failures; internal recon sweep via NAT'd IP 10.x.x.x against DC-1 (10.x.x.x) across ports 53, 445, 389, 88, 443	IdentityLogonEvents, NTANetAnalytics	B1, B2
2026-08-06 ~11:53:18 UTC	"GF Pipe - Post-Exploitation Framework Named Pipe" High alert fires (SharpHound-style named-pipe recon on DC-1), 37s before the malicious reset	SecurityAlert (On-Prem Workspace)	O1, O8, T3
2026-08-06 11:53:55 UTC	SVC-BOT-A executes reset_account_password against USER-B via prompt-injected ticket content citing forged reference GF-IR-4488; password set to attacker-dictated value	LLMAgentLogs_CL, MCPToolCalls_CL, SecurityEvent (4724)	O2-O8, S1, S2
2026-08-06, shortly after 11:53:55 UTC	Certificate request/issue pair (RequestId 9) against template GF-PrivilegedAccessLogon; SAN = USER-B@REDACTED-DOMAIN (ESC13 escalation)	WindowsCertServices_CL	O9, O10
2026-08-06 12:10:17 UTC	Malicious ACE added to domain root nTSecurityDescriptor (DC=greenfield,DC=local), granting DS-Replication rights, performed as USER-B	SecurityEvent (4662, AccessMask 0x40000)	O11, O13
2026-08-06 12:16:37-12:16:42 UTC	DCSync: USER-B exercises DS-Replication-Get-Changes-All 39 times in 5 seconds, extracting AD secrets including krbtgt via DRSUAPI	SecurityEvent (4662, GUID 1131f6ad)	O12
2026-08-06 12:21:50 UTC	Cloud-side MDI alert "Suspected DCSync attack" fires	SecurityAlert (Cloud Workspace)	T3, T4
2026-08-06 12:30:54 UTC	Cloud-side MDI alert "DCSync attack replication" fires	SecurityAlert	T3
2026-08-06 12:50:08 UTC	No-op rewrite of the same domain-root ACE (identical ACL bytes re-asserted) — the write a latest-write audit baselines against	SecurityEvent (4662, 0x40000)	O13
2026-08-06 12:53:23 UTC	On-prem SecurityIncident 466 ("GF Directory - Replication Rights By Non-Machine Account") created — 36m46s after FirstActivityTime; status remained New/unassigned indefinitely	SecurityIncident	O15, S3
2026-08-06 12:59:01 UTC	USER-A reads employee_records.csv from *\Finance (PII: SSN/DOB for 5 employees)	SecurityEvent (5145)	O18, O19
2026-08-06, sweep ending ~12:59:07 UTC	USER-A's session sweeps 9 distinct shares total; credentials.txt (DSRM/FTP/SVC-BACKUP-A creds) and Groups.xml (GPP cpassword) also taken; USER-B's own share access that evening is limited to IPC\$ only (recon, not a file read)	SecurityEvent (5140, 5145)	O16, O17, O18

5. Findings

F1, Initial access via session/token replay, not password compromise

Finding:

The attacker gained entry to USER-A's account by replaying a stolen session/cookie token, not by guessing, phishing, or brute-forcing a password.

Evidence:

IdentityLogonEvents shows a LogonFailed at 2026-08-05 18:44:47 UTC immediately followed by a LogonSuccess at 18:44:52 UTC from Singapore IP [REDACTED-IP-EXTERNAL]; SecurityAlert corroborates with "Possible use of a stolen session cookie" at 19:04:50 UTC (T1, C1).

Analysis:

No successful interactive password-based sign-in for the attacker exists anywhere in the reviewed telemetry (see Negative Findings). Confidence: High.

F2, Cloud reconnaissance via AzureHound, partially blocked by Conditional Access

Finding:

The attacker used AzureHound to enumerate the Azure/Entra directory at a sustained automated rate, but was blocked from viewing privileged-role assignments and from reaching Azure Resource Manager.

Evidence:

MicrosoftGraphActivityLogs shows ~1227 calls against 1118 unique targets in a single 60-second window (~20.5 calls/sec) from [REDACTED-IP-EXTERNAL]; the same window shows 3 of 4 non-200 responses on PIM (role) endpoints (403/404); AADNonInteractiveUserSignInLogs shows ARM requests failing with 50076 (Conditional Access requiring MFA on a non-interactive request) (C9, C10, C12).

Analysis:

The attacker could map the directory freely but was fully walled off from identifying or reaching privileged roles through this path. Confidence: High.

F3, Credential-store exfiltration from OneDrive

Finding:

The attacker downloaded multiple password vaults, an MFA/TOTP seed source, and a plaintext VPN credential file from USER-A's OneDrive.

Evidence:

CloudAppEvents 2026-08-05 18:59-19:07 UTC shows FileDownloaded/FileRestored events for Personal.kdbx, personalnew.kdbx, "Personal new main.kdbx", KeePass-Emergency-Sheet.pdf, and VPN-Access-Credentials.txt (C4, C5).

Analysis:

VPN-Access-Credentials.txt is the file that later enabled the on-prem network pivot (B1); the KeePass vault is the source of the stolen TOTP seed (B1). Confidence: High.

F4, Covert mailbox forwarding bypassing rule-based detection

Finding:

Mail forwarding was configured directly on USER-A's mailbox object, not via an inbox rule, and the resulting bounce evidence was deleted within seconds.

Evidence:

OfficeActivity Set-Mailbox activity sets ForwardingSmtpAddress to [REDACTED-EMAIL] with DeliverToMailboxAndForward enabled; two NDR bounce notifications are SoftDeleted from Deleted Items within seconds of arrival shortly after (C6, C7).

Analysis:

A conventional inbox-rule hunt would have returned clean; mailbox-level forwarding requires a different query (Get-Mailbox/ForwardingSmtpAddress) to surface (IR7). Confidence: High.

F5, Automated risk-engine dismissal with no analyst review

Finding:

Two Identity Protection risk detections tied to the attacker's session were automatically dismissed by Azure AD's own risk engine while the session was still active.

Evidence:

AADUserRiskEvents shows two anonymizedIPAddress detections with RiskDetail = aiConfirmedSigninSafe (C8).

Analysis:

The detections were silently resolved with no human review at any point during the live compromise. Confidence: High.

F6, On-prem pivot using stolen TOTP seed and VPN credential

Finding:

The attacker authenticated to the corporate VPN using the stolen TOTP seed and VPN credential, succeeding on the first attempt with no MFA failures, then swept the internal network from the VPN's NAT'd address.

Evidence:

IdentityLogonEvents shows a clean, first-try VPN authentication (no failed attempts) (B1); NTANetAnalytics shows 10.x.x.x (VPN NAT) sweeping DC-1 (10.x.x.x) across ports 53, 445, 389, 88, 443 in sequence (B2).

Analysis:

A first-try, no-failure TOTP satisfaction is inconsistent with a relayed one-time code and consistent with possession of the actual seed (B1). Confidence: High (inferred from authentication pattern).

F7, On-prem enumeration consistent with SharpHound

Finding:

Behavioral evidence on the domain controller matches SharpHound-style AD enumeration, the on-prem twin of the AzureHound activity in F2.

Evidence:

DeviceNetworkEvents shows an IPC\$ named-pipe burst on DC-1 (ports 445/139/135); DeviceFileEvents shows a randomly-named artifact dropped on a network share shortly after (O1).

Analysis:

No process name, hash, or command line directly confirms SharpHound — this is an inference from TTP pattern alone, not direct tool observation. Confidence: Medium.

F8, AI helpdesk agent manipulated via prompt injection to reset a credential

Finding:

SVC-BOT-A, an AI agent, was manipulated via a forged instruction block appended to a genuine support ticket into resetting USER-B's password to an attacker-chosen value, with only superficial, unverified authorisation.

Evidence:

LLMAgentLogs_CL shows the ticket's retrieved_content containing a forged "[GF-SEC-REMEDIATION]" block citing reference GF-IR-4488; gate_decision = allowed on gate_marker_text = GF-IR-4488 (a pattern match, not a verification); MCPToolCalls_CL shows tool = reset_account_password, arguments.password_source = caller_supplied, caller = USER-A, target = USER-B — a cross-account reset. SecurityEvent EventID 4724 confirms the write at 2026-08-06 11:53:55 UTC (O2-O8).

Analysis:

This is the root cause of the entire on-prem compromise chain that follows. Confidence: High.

F9, Certificate-based escalation via ADCS template misconfiguration (ESC13)

Finding:

The attacker obtained a privileged-access certificate for USER-B via a misconfigured certificate template, shortly after the malicious password reset.

Evidence:

WindowsCertServices_CL shows a matched 4886/4887 request-and-issue pair (RequestId 9) for template GF-PrivilegedAccessLogon, with SubjectAlternativeName = Principal Name=USER-B@REDACTED-DOMAIN (O9, O10).

Analysis:

Because the certificate's SAN matched the legitimate enrollee, strong certificate binding had nothing to reject; the escalation path runs through the template's own configuration (ESC13), not a binding bypass. Confidence: High.

F10, Domain-root ACL backdoor disguised by a no-op second write

Finding:

A malicious ACE was added directly to the domain root's security descriptor granting DCSync-class replication rights, then rewritten a second time with no actual change — defeating a latest-write-baseline permissions audit.

Evidence:

SecurityEvent EventID 4662 (AccessMask 0x40000, Write DAC) on the domain root object shows two writes by USER-B: the real write at 2026-08-06 12:10:17 UTC (adding the ACE, before the DCSync burst) and a no-op rewrite at 12:50:08 UTC (identical ACL bytes, after the burst) (O11, O13).

Analysis:

An audit that diffs only the most recent security-descriptor write against itself would find no change and report the object clean, missing the earlier write entirely. Confidence: High.

F11, DCSync extraction of the full AD secrets database, including krbtgt

Finding:

The attacker extracted AD's full secrets database via DCSync, using the replication rights granted in F10.

Evidence:

SecurityEvent EventID 4662 shows USER-B exercising DS-Replication-Get-Changes-All (GUID 1131f6ad-...) 39 times in a 5-second window (12:16:37-12:16:42 UTC), with no corresponding process or memory-access activity on the DC, consistent with the DRSUAPI replication protocol rather than a memory-dumping tool (O12).

Analysis:

krbtgt is among the extracted secrets, giving the attacker Golden Ticket forgery capability across the domain until remediated (see IR3, Recommendations). Confidence: High.

F12, On-prem file theft including credentials and employee PII

Finding:

Using USER-A's already-legitimate share access, the attacker swept 9 distinct file shares and stole two further credential files and a file containing personal data for five employees.

Evidence:

SecurityEvent (5140/5145) shows USER-A accessing 9 distinct shares (IPC\$, ADMIN\$, CertEnroll, C\$, Finance, IT, NETLOGON, Public, SYSVOL); recovered files include credentials.txt (DSRM, FTP, and SVC-BACKUP-A credentials), Groups.xml (a GPP file whose cpassword decrypts to a plaintext helpdesk local-admin password using Microsoft's long-published AES key), and employee_records.csv, read from *\Finance at 2026-08-06 12:59:01 UTC (O16-O19). USER-B's own share access that evening is limited to IPC\$ only.

Analysis:

employee_records.csv contains SSN/DOB for one individual (EMP-A) with no other operational tie to the incident anywhere in the investigation — his exposure is what elevates this from an access compromise to a reportable data breach.

Confidence: High.

F13, Correctly-fired incident left unactioned (response failure)

Finding:

The DCSync activity was correctly detected, attributed, and correlated into a security incident, but that incident was never triaged or worked.

Evidence:

SecurityIncident 466 ("GF Directory - Replication Rights By Non-Machine Account") shows Status = New, Owner = null, and LastModifiedTime identical to CreatedTime — no action recorded since it fired at 12:53:23 UTC (O15, S3).

Analysis:

This is a triage/response failure, not a detection failure — the tooling worked. Confidence: High.

F14, No detection coverage exists for the actual root-cause action

Finding:

The single highest-quality piece of evidence in the entire case — the AI agent's manipulated tool call — sits in a log source that no existing detection content watches at all.

Evidence:

O8's full alert sweep across both workspaces found zero alerts tied to the password reset, the group/account change, or the agent's tool execution; LLMAgentLogs_CL and MCPToolCalls_CL capture the attacker's action verbatim but have no correlation rule joining them to identity telemetry (SecurityEvent EventID 4724) that would catch it at the moment of execution (S1, S2).

Analysis:

A cross-source rule joining LLMAgentLogs_CL to SecurityEvent on matching account within a tight time window would have fired at 2026-08-06 11:53:55 UTC, the moment of execution. Confidence: High.

6. Negative findings

Looked for	Where	Method applied	Conclusion
Malicious inbox rule (New-InboxRule)	OfficeActivity	Filtered Operation to inbox-rule cmdlets across the full window	None found — forwarding was set at the mailbox-object level (ForwardingSmtpAddress) , not via a rule (C6, IR7)
Alert/incident tied to the password reset, group/account change, or agent tool execution	SecurityAlert, both workspaces	Swept the full alert table across the incident window, filtered by severity and by proximity in time	None exists — nearest alert (SharpHound named-pipe) fires 37s prior but is unrelated to the reset itself (O8)
Successful interactive password-based sign-in for the attacker	SigninLogs, IdentityLogonEvents	Reviewed full sign-in history for the compromised identity across the window	None — entry was via session/cookie replay and later a stolen TOTP seed, never a guessed or brute-forced password (T1, C1, B1, IR1)
Second identity sharing the attacker's exit IP via interactive sign-in	SigninLogs	Summarised UserPrincipalName by IPAddress	None in interactive logs; surfaced only in non-interactive sign-in telemetry (ADMIN-A), and ruled unrelated to the incident (C2)
Group-membership write following the self-service group management read	AuditLogs	Searched all audit records tied to the identity's object ID	Only one record exists (a read); no corresponding write — the group-based persistence attempt was checked but never completed (C11)

Looked for	Where	Method applied	Conclusion
ADCS certificate-binding rejection of the fraudulently issued certificate	WindowsCertServices_CL, event 4887	Compared SubjectAlternativeName to enrollee identity	SAN matched the enrollee exactly — strong certificate binding had nothing to reject; escalation succeeded via template misconfiguration (ESC13), not a binding bypass (O10)

7. MITRE ATT&CK mapping

Tactic	Technique	ID	Evidence ref
Initial Access	Steal Web Session Cookie	T1539	T1, C1
Credential Access	Credentials from Password Stores: Password Managers (KeePass)	T1555.005	C4, C5
Discovery	Cloud Infrastructure Discovery (AzureHound)	T1580	C9, C10
Persistence	Account Manipulation: Additional Email Delegate Permissions (mailbox forwarding)	T1098.002	C6
Defense Evasion	Indicator Removal: Clear Mailbox Data	T1070	C7
Initial Access / Lateral Movement	External Remote Services (VPN pivot via stolen credentials/TOTP)	T1133	B1, B2
Discovery	Network Service Discovery (internal port sweep)	T1046	B2
Discovery	Account/Domain Trust Discovery (SharpHound-style enumeration)	T1087.002 / T1482	O1
Initial Access / Privilege Escalation	Manipulation of an AI/LLM agent via injected instructions in retrieved content (no mature legacy ATT&CK ID; closest parent is Trusted Relationship, T1199)	T1199 (approximate)	O3-O8
Credential Access	Unsecured Credentials: Group Policy Preferences (GPP cpassword)	T1552.006	O16
Credential Access	Unsecured Credentials: Credentials In Files	T1552.001	O17
Privilege Escalation / Persistence	Steal or Forge Authentication Certificates (ADCS ESC13 template misuse)	T1649	O9, O10
Persistence / Privilege Escalation	Domain Policy Modification / Account Manipulation (domain-root ACE)	T1098 / T1484	O11, O13

Tactic	Technique	ID	Evidence ref
Credential Access	OS Credential Dumping: DCSync	T1003.006	O12
Collection / Exfiltration	Data from Network Shared Drive; Exfiltration Over Web Service	T1039 / T1567	O18, O19

8. Recommendations

#	Recommendation	Addresses	Priority	Owner
1	Require verified authorisation (a real ticket/approval-system lookup, not free-text pattern matching) before any AI agent tool call can execute a sensitive action	F8 (root cause)	Critical	Platform/Agent Engineering
2	Deploy an automation rule to auto-assign and escalate high-severity incidents the moment they are created	F13 (response failure)	Critical	SOC Management
3	Build a cross-source correlation rule joining LLMAgentLogs_CL tool calls to identity telemetry (SecurityEvent 4724) on matching account within a tight time window	F14 (detection coverage gap)	High	Detection Engineering
4	Migrate MFA from TOTP to phishing-resistant, hardware-bound FIDO2/WebAuthn	F1, F6 (MFA bypass via stolen seed)	High	IAM
5	Remove/replace the vulnerable GPP object and purge cpassword-bearing GPOs domain-wide	F12	High	AD Platform team
6	Remediate the ADCS template (disable ENROLLEE_SUPPLIES_SUBJECT, tighten enrollment, or retire GF-PrivilegedAccessLogon)	F9	High	PKI/ADCS admin
7	Execute the full credential rotation sequence in dependency order: sessions/tokens, domain-root ACE, krbtgt (x2), DSRM, downstream accounts, then source vaults	F10, F11, F12	Critical	IR team
8	Secure/replace shared-secret vault storage of MFA seeds; do not store TOTP seeds alongside general passwords	F3, F6	Medium	IAM / end-user security
9	Enable alerting on mailbox-level ForwardingSmtpAddress changes, not just inbox-rule changes	F4	Medium	Messaging/Exchange admin

PART B, the tail (complete ONE)

Compromise confirmed: YES. B2 (Incident tail) is completed below. B1 (Threat Hunt tail) is marked N/A per the decision gate; its hypothesis section is used as the opening lead for B2.

B1, Threat Hunt tail

B1.1 Hypothesis and outcome

Hypothesis (falsifiable, not "look for evil"):N/A — no compromise found is not applicable here; a compromise was confirmed via direct evidence (O2-O19), so this investigation completed as an incident, not a threat hunt. For reference, the working hypothesis carried in from triage was: "The correlated on-prem replication-rights incident represents a genuine DCSync attack chain originating from a cloud identity compromise, not a false positive or isolated on-prem misconfiguration."

Outcome: Proved / Disproved / InconclusiveN/A (see above) — Proved, via the full chain documented in Part A Findings F1-F14.

B1.2 ATT&CK coverage, hunted but not observed

Tactic	Technique	ID	Why it was in scope
N/A	N/A	N/A	Compromise confirmed — B1 tail not applicable, see B2

B1.3 Detection and telemetry gaps

Gap	Impact	Fix	Owner
N/A	N/A	N/A	Compromise confirmed — B1 tail not applicable, see B2

B1.4 New detections authored

Name	Logic summary	Data source	Tuning caveats
N/A	N/A	N/A	Compromise confirmed — B1 tail not applicable, see B2

B2, Incident tail

Complete when a compromise was confirmed. Shaped by SANS PICERL; framing cites NIST SP 800-61r3. Note: Rev 3 reframes IR around CSF 2.0 Functions, do not call the six Functions a "six-phase lifecycle".

B2.1 Impact and dwell time

First malicious activity (UTC)	2026-08-05 18:44:47 UTC (stolen session cookie use against USER-A)
--------------------------------	--

First detection (UTC)	2026-08-05 19:04:50 UTC (SecurityAlert: Possible use of a stolen session cookie); meaningful correlated detection of the core AD compromise (incident 466) was not created until 2026-08-06 12:53:23 UTC
Dwell time to detection	~20 minutes to first alert (19:04:50 minus 18:44:47); ~18h09m to the incident that actually captured the domain compromise (12:53:23 UTC Aug 6 minus 18:44:47 UTC Aug 5)
Time to containment	Not established — incident 466 was created and never triaged (Status = New, Owner = null; see F13). No evidence of analyst-driven containment exists in the reviewed telemetry window. Recorded as a finding, not a number, per the honesty-over-completeness rule.
Data confirmed accessed	Invoice_Reconciliation_Q3.xlsx; KeePass vaults (Personal.kdbx, personalnew.kdbx, "Personal new main.kdbx"); KeePass-Emergency-Sheet.pdf; VPN-Access-Credentials.txt; credentials.txt (DSRM, FTP, SVC-BACKUP-A); Groups.xml (helpdesk local-admin cpassword); employee_records.csv (PII, 5 records); the full AD secrets database via DCSync (all account hashes, including krbtgt)
Data confirmed exfiltrated	Confirmed downloaded/read from cloud (OneDrive) and on-prem shares via CloudAppEvents and SecurityEvent 5145 read/download actions; DCSync-extracted AD secrets confirmed extracted via the DRSUAPI protocol (O12). Outbound network egress of this data beyond the DC/tenant boundary was not separately confirmed in the reviewed telemetry — recorded as a gap, not assumed.
Business impact	Domain-wide credential compromise, including krbtgt (Golden Ticket forgery capability until remediated); PII exposure creating a statutory breach-disclosure obligation for at least one uninvolved employee; compromise of local admin, service, and DC recovery (DSRM) credentials across the on-prem and cloud estate.

B2.2 Root cause

The root cause is that the AI helpdesk agent (SVC-BOT-A) was permitted to execute a sensitive, irreversible action (a password reset) based solely on unverified content embedded in ticket text — the authorisation "gate" pattern-matched a reference-shaped string rather than checking it against any real authorisation source (F8). Every downstream step — the certificate escalation, the domain-root ACE, the DCSync extraction, and the file theft — was possible only because that first check was cosmetic. Contributing root causes: (a) MFA was implemented via a shared-secret (TOTP) stored alongside other credentials in a single vault, so one vault compromise defeated MFA entirely (F3, F6); (b) a legacy, world-readable GPP object was left in place for years (F12); (c) a misconfigured ADCS template permitted attacker-controlled certificate issuance (F9); (d) no cross-source detection linked AI-agent tool calls to their downstream identity consequences (F14); (e) no automated incident triage existed, so even a correctly-fired, correctly-correlated incident (466) went unworked (F13).

B2.3 Containment, eradication, recovery

Phase	Action	Naive move it rejects	Time (UTC)	Owner
Contain	Revoke active sessions/refresh tokens for USER-A, ADMIN-A, USER-B, and SVC-BOT-A	Rejects "just reset the password" — a reset does not invalidate an already-issued, replayed session/token (IR1)	Not executed during observed window — recommended immediate action	IAM / IR
Contain	Do not rely on edge IP blocking of the four attacker exit addresses as primary containment	Rejects "block the IPs at the firewall" — attacker exit infrastructure is disposable/rotatable and blocking it gives false confidence of containment (IR2)	N/A — decision, not an executed action	Network / IR
Eradicate	Strip the malicious ACE from the domain root's nTSecurityDescriptor	Rejects "disable the account / empty the Tier-0 group / revoke the certificate alone" — none of those touch the ACL; the ACE survives all three (IR4)	Not executed during observed window — recommended immediate action	AD Platform
Eradicate	Rotate krbtgt password twice, with the gap between resets covering full AD replication convergence (and exceeding max Kerberos ticket lifetime)	Rejects "rotate once" (leaves the n-1 hash valid for forged tickets) and "rotate twice back-to-back" (breaks live authentication domain-wide before replication converges) (IR3)	Not executed during observed window — recommended immediate action	AD Platform
Eradicate	Remediate the GF-PrivilegedAccessLogon certificate template (disable ENROLLEE_SUPPLIES_SUBJECT / restrict enrollment) rather than only revoking the issued certificate	Rejects "just revoke the certificate" — leaves the template able to re-issue an identical credential on the next enrollment (IR5)	Not executed during observed window — recommended immediate action	PKI/ADCS admin
Eradicate	Remove/replace the vulnerable GPP object before rotating the helpdesk local-admin password	Rejects "rotate the password now" — republishes the new password in the same world-readable cpassword format (IR10/O16)	Not executed during observed window — recommended immediate action	AD Platform
Recover	Execute full credential rotation in dependency order: sessions -> domain-root ACE removed -> krbtgt x2 -> DSRM -> USER-B -> ADMIN-A -> SVC-BOT-A/MCP -> SVC-BACKUP-A -> GPP object + helpdesk admin -> FTP -> KeePass vault -> TOTP migrated to FIDO2 -> USER-A (IR10)	Rejects rotating credentials in an arbitrary or blast-radius-blind order, which re-exposes higher-value secrets via still-open lower-priority channels	Not executed during observed window — recommended sequence for IR team	IR / IAM

Phase	Action	Naive move it rejects	Time (UTC)	Owner
Recover	Migrate MFA from TOTP to hardware-bound FIDO2/WebAuthn	Rejects "re-enrol TOTP" — reissues the same phishable, stealable shared-secret mechanism the attacker already exploited (IR8)	Not executed during observed window — recommended action	IAM

B2.4 Indicators of compromise

Type	Indicator	Context	Confidence
TTP	AI-agent prompt injection via forged "[GF-SEC-REMEDIATION]" ticket block	Root-cause technique; hardest for the attacker to change	High
TTP	Domain-root ACL persistence via a real write followed by a disguising no-op write, defeating latest-write-baseline audits	Core persistence mechanism	High
Tool	AzureHound (cloud reconnaissance)	Identified via UserAgent in MicrosoftGraphActivityLogs	High
Tool	SharpHound-style named-pipe enumeration (on-prem reconnaissance)	Inferred from IPC\$ pipe burst plus a dropped share artifact; no direct process/hash evidence	Medium
Host artifact	Domain-root ACE granting DS-Replication-Get-Changes-All (object GUID 54880cca-f739-4811-aae4-f28e1b0d22b2)	SecurityEvent 4662, AccessMask 0x40000	High
Host artifact	Certificate template GF-PrivilegedAccessLogon (ESC13 misuse), RequestId 9	WindowsCertServices_CL 4886/4887	High
Domain/Email	[REDACTED-EMAIL] (forwarding destination)	OfficeActivity Set-Mailbox ForwardingSmtpAddress	High
Network	Internal NAT 10.x.x.x (VPN gateway translation of attacker session) to DC-1 10.x.x.x, ports 53/445/389/88/443	NTANetAnalytics	Medium
IP	[REDACTED-IP-EXTERNAL] (Singapore, attacker exit address)	Observed across SigninLogs and MicrosoftGraphActivityLogs; low value as a blocking control — cheap, rotatable infrastructure (IR2)	High as an observed IOC / Low value for blocking
Credential (rotate, do not treat as a static IOC)	[REDACTED-CREDENTIAL] — helpdesk local-admin password, decrypted from Groups.xml	O16	High
Credential (rotate, do not treat as a static IOC)	[REDACTED-CREDENTIAL] — DC local recovery-mode admin password	credentials.txt (O17)	High

B2.5 Chain of custody

Evidence item	Collected (UTC)	By	Hash	Storage
Groups.xml (GPP file)	2026-08-11 (session date; exact UTC not logged)	David Koschmann	Not computed during this exercise — recommend SHA-256 on the original artifact before further handling	Case working folder
credentials.txt	2026-08-11	David Koschmann	Not computed	Case working folder
employee_records.csv	2026-08-11	David Koschmann	Not computed	Case working folder
KQL query result exports (CSV/screenshots)	Throughout the 2026-08-11 investigation session	David Koschmann	N/A — query exports, not files under formal custody	Workspace query history / case notes

B2.6 Regulatory notification

Personal data involved	Yes — SSNs and dates of birth for 5 employees (employee_records.csv), read by the compromised USER-A session at 2026-08-06 12:59:01 UTC
Regulation(s) engaged	US state breach-notification law (assessed jurisdiction: United States, based on SSN format and Greenfield Logistics' operating context)
Notification required	Yes — SSN + name is a defined "personal information" combination triggering notification under most US state statutes (e.g., a representative standard such as California's Civ. Code 1798.82)
Deadline (UTC)	2026-09-05 UTC (representative 30-day "without unreasonable delay" standard, calculated from discovery/incident creation at 2026-08-06 12:53:23 UTC)
Notified (UTC)	Not yet notified as of report issue date (2026-08-11) — within the assessed deadline; notification action owned by legal/privacy team

Appendices (always)

- A. Full queries
- B. Raw evidence extracts
- C. Reference list (ATT&CK, and PEAK/TaHiTi or NIST SP 800-61r3/CISA as used, real links)

A. Full queries and raw evidence extracts for every finding (T1-T4, C1-C12, B1-B2, O1-O19, S1-S3, IR1-IR10) are recorded in the companion working document, operationHelpline.docx, maintained throughout this engagement. B. See the same document for evidence screenshots/CSV exports referenced by finding ID. C. References: MITRE ATT&CK (attack.mitre.org); NIST SP 800-61r3 (Incident Response Recommendations and Considerations, csrc.nist.gov); SANS PICERL incident response model.

Appendix A — Full Queries

T1 — The Second-Guessed Cookie

SecurityAlert
| where AlertName has "cookie"

```
| extend TimeUTC = format_datetime(TimeGenerated, 'yyyy-MM-dd HH:mm:ss')
| extend QueryRunUTC = format_datetime(now(), 'yyyy-MM-dd HH:mm:ss')
| project TimeUTC, QueryRunUTC, AlertName, ProductName, AlertSeverity, ProviderName, Description
```

T2 — The Second High

SecurityAlert

```
| where TimeGenerated between (datetime(2026-08-05) .. datetime(2026-08-07))
| where AlertSeverity == "High"
| where ProviderName has "Advanced Threat"
| project TimeUTC=format_datetime(TimeGenerated,'yyyy-MM-dd HH:mm:ss'), AlertName, Description
```

T3 — The False Positive

SecurityAlert

```
| where TimeGenerated between (datetime(2026-08-05) .. datetime(2026-08-07))
| where AlertSeverity == "High"
| project TimeUTC=format_datetime(TimeGenerated,'yyyy-MM-dd HH:mm:ss'), AlertName, Description
| sort by TimeUTC asc
```

T4 — The Unactioned Window

(No standalone query — derived from the T1 alert timestamp and the first on-prem MDI DCSync alert timestamp already captured under T3/O12.)

C1 — First Contact

IdentityLogonEvents

```
| where TimeGenerated between (datetime(2026-08-05 18:40:00) .. datetime(2026-08-05 19:10:00))
| extend MillisecondTime = format_datetime(TimeGenerated, 'HH:mm:ss.fff')
| project TimeGenerated, MillisecondTime, AccountUpn, ActionType, Application, IPAddress, Location
| sort by TimeGenerated asc
```

C2 — The Other Identity

// Query 1 — interactive sign-ins

SigninLogs

```
| where IPAddress == "[REDACTED-IP-EXTERNAL]"
| summarize count() by UserPrincipalName
```

// Query 2 — non-interactive sign-ins

AADNonInteractiveUserSignInLogs

```
| where TimeGenerated > ago(30d)
| where IPAddress == "[REDACTED-IP-EXTERNAL]"
| summarize count() by UserPrincipalName
```

C3 — The Pivot Record

UrlClickEvents

```
| take 20
```

C4 — The Restored Vault

CloudAppEvents

```
| where TimeGenerated between (datetime(2026-08-05 18:44:00) .. datetime(2026-08-06 13:00:00))
| where AccountObjectId has "USER-A" or Application has "SharePoint" or Application has "OneDrive"
| project TimeGenerated, ActionType, ObjectName, IPAddress, Application
| sort by TimeGenerated asc
```

C5 — The Bridge File

CloudAppEvents

```
| where TimeGenerated between (datetime(2026-08-05 18:59:00) .. datetime(2026-08-05 19:07:00))
| where ActionType in ("FileDownloaded", "FileAccessed")
| where Application has "OneDrive"
| project TimeGenerated, ActionType, ObjectName, IPAddress
| sort by TimeGenerated asc
```

C6 — The Hidden Forward

OfficeActivity

```
| where Operation == "Set-Mailbox"
| where TimeGenerated between (datetime(2026-08-05 18:44:00) .. datetime(2026-08-07 00:00:00))
| where UserId has "USER-A" or Parameters has "USER-A" or Parameters has "smith"
| project TimeGenerated, UserId, Parameters
| sort by TimeGenerated asc
```

C7 — The Deleted Bounces

OfficeActivity

```
| where TimeGenerated between (datetime(2026-08-05 00:00:00) .. datetime(2026-08-07 00:00:00))
| where UserId has "USER-A"
| where Operation == "SoftDelete"
| mv-expand AffectedItems = parse_json(AffectedItems)
| project TimeGenerated, Operation, UserId, Subject = tostring(AffectedItems.Subject)
| sort by TimeGenerated asc
```

C8 — The Auto-Dismissal

AADUserRiskEvents

```
| where TimeGenerated between (datetime(2026-08-05 00:00:00) .. datetime(2026-08-07 00:00:00))
| where UserPrincipalName has "USER-A"
| project TimeGenerated, RiskEventType, RiskState, RiskDetail, RiskLevel
| sort by TimeGenerated asc
```

C9 — The Automated Burst

MicrosoftGraphActivityLogs

```
| where TimeGenerated between (datetime(2026-08-05 20:09:00) .. datetime(2026-08-05 20:10:00))
| where IPAddress == "[REDACTED-IP-EXTERNAL]"
| summarize CallCount = count(), UniqueTargets = dcount(RequestUri) by IPAddress
```

C10 — The Refused Reads

MicrosoftGraphActivityLogs

```
| where TimeGenerated between (datetime(2026-08-05 20:09:00) .. datetime(2026-08-05 20:10:00))

Appendix C — Reference List

This engagement confirmed a compromise and was written up against the Incident tail (B2), shaped by SANS PICERL and framed per NIST SP 800-61r3. PEAK/TaHiTi (hunt-tail framing) was not used, as B1 was marked N/A.
